Digital Twin for Warehouse Monitoring for DMI

euristiq + DMI

Architecture | Front-end development | QA | PWA development | Integration services

DMI is a company that provides IoT hardware and software solutions for organizations that automate the collection of site and asset data and transform it into actionable insights. We helped to built two web applications that work as an intelligent warehouse monitoring system, providing analytics, and real-time alerts from a large number of sensors located in different sites. The application complements the devices manufactured by our client, providing significant added value for their customers.

TECHNOLOGY STACK

HTML/CSS | JavaScript | Angular | Jest | Node.js | MapBox | Matterport | AWS

OUTCOMES

- Cloud-based IoT architecture on AWS for real-time warehouse monitoring
- Edge computing implementation reducing latency and improving data processing
- New UX/UI design enhancing usability and operational efficiency
- Integration with third-party logistics and ERP systems for seamless data exchange
- Advanced data analytics providing real-time insights for inventory management
