Online Document Verification Service by SecureKey (now Gen Digital)

euristiq + Gen

Web development | DevOps | Cybersecurity & data protection | Architecture | QA/QC testing | Integration services

Our client, an identity and authentication provider based in Canada, seized this opportunity to create a product that offers the same level of trust as in-person transactions, mitigating the risks of fraud and identity theft in online interactions.

We helped develop a highly secure document verification service that avoids sharing any personal information, login credentials, passwords, bank identities, or details about accessed government services with either the government or the bank.

TECHNOLOGY STACK

MVC | SQL | HTML/CSS | JavaScript | jQuery | Java | AJAX | Spring Boot | ETCD | PostgreSQL | HSM | Node.js

OUTCOMES

- Desktop identity verification app for scanned documents
- Integration of biometrics & real-time document checks
- Robust encryption protocols for data security
- Audit log system for event tracking without personal data
- DevOps services based on AWS
- Expanded authentication solutions via service integration
