IoT-based Utility Monitoring System

euristiq

Architecture engineering | Front-end/back-end development | QA | UI/UX design

An international engineering consulting group, headquartered in Denmark, engaged Euristiq for the end-to-end development of an integrated utility monitoring system (UMS) for asset management. The web-based IoT system we developed monitors conditions and performance online, identifying areas for maintenance work and improvement. Combined with other products developed by the client, the system helps reduce high water loss in Oslo, Norway.

TECHNOLOGY STACK

Java | Hibernate | Spring Framework | DDD | CQRS | Google Chrome Web | Angular | Bluetooth API

OUTCOMES

- A web-based IoT system that gathers and analyses utility company's data
- The system integrates with the utility company's existing IT platform
- Contributes to a more than x10 decrease in time for troubleshooting and problem resolution and reduces operating costs by 15%
