Advanced Foot Traffic Analytics

An international hardware manufacturer partnered with Euristiq to develop a retail IoT system for in-store foot traffic analytics. The solution generates heat maps to identify high-traffic areas and enables energy optimization through remote lighting controls on iPad or iPhone.

Discovery | MVP | IoT | Data collection & processing

Outcomes

Cost-efficient foot traffic analytics
We developed a triangulation-based system to identify high-traffic store zones, helping retailers optimize product and ad placement to increase revenue..

System aggregates data and forms heat maps
The system processes and visualizes customer traffic, generating heat maps to highlight busy zones and reveal customer journeys, helping store owners make data-driven decisions.

Controls energy consumption
The system optimizes energy consumption with remote lighting controls via iPad or iPhone, allowing scheduled dimming, lighting groups, and scenes to create more appealing retail spaces.
