From Outdated to Precision Farming

The client is a precision farming company building dependable, accurate, cost-effective agriculture solutions. They needed to modernize an outdated system serving thousands of users and tens of thousands of farming sensors and devices, so Euristiq began with a project discovery phase.

Discovery | IoT | Legacy modernization | Mobile | Cloud infrastructure & development | Custom software development

Outcomes

Workshops and tech-stack analysis
Workshops aligned business priorities, assessed the tech stack, and defined a scalable architecture for current and future device fleets.

Cost estimate for gradual transformation
We prepared a cost estimate validating the proposed solution, ensuring the precision farming software's transformation would be gradual and affordable at every step.

Detail-rich SRS and roadmap
All results of the project discovery were documented in a detail-rich SRS document. Hence, the client received a roadmap with all the stages comprehensively described and calculated.
