Loan Origination Platform

A UK real estate lender’s loan book was outgrowing its legacy platform, which ran the entire loan lifecycle through a single vendor. Euristiq built a middleware layer connecting nCino (origination) and Mambu (core banking and servicing), replacing that single point of failure with a best-of-breed setup.

Legacy modernization | Event-driven architecture | nCino & Mambu integration | Loan origination & servicing | Azure

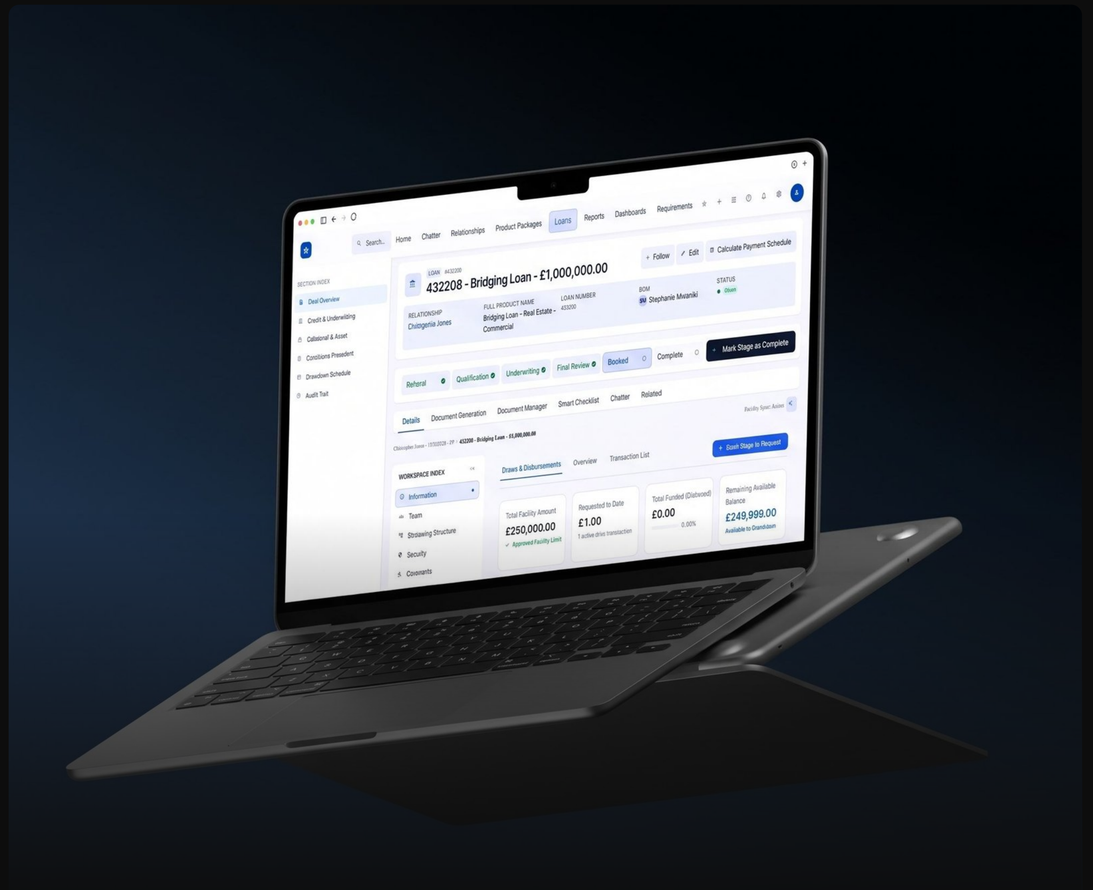

Outcomes

20+ loan flows automated
End-to-end, from application through servicing and statements.

100% legacy-parity shipped
Validated against real migrated loan data before go-live.

PII-safe by design
No customer data persisted in the integration layer; processing is fully idempotent.

Full lifecycle trace visibility
End-to-end distributed tracing from entry point through orchestration.
