Technology for Verifiable Digital Credentials

The customer recognized growing demand for trusted digital identity services for government applications. Leveraging our AWS expertise, we built a secure, blockchain-based identity platform that enables users to manage verifiable digital credentials and ensures interoperability across decentralized systems.

Custom software development | AWS | Integration services

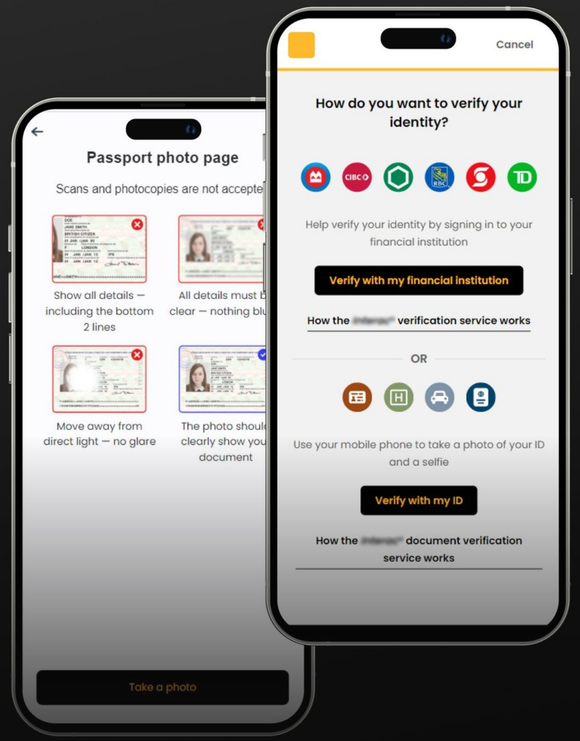

Outcomes

A digital identity verification platform used by the government of Canada

Compliant with W3C standards

Integration with governmental institutions, banks, financial institutions, and other third-party databases

Instant identity verification using digital versions of passports, licenses, and birth certificates
