IoT Testing Services for Telematics App

The client is an insurance company from the UK working with fleet and logistics companies. Since drivers are often careless about their behavior on the road, the client decided to create a separate service that would monitor road incidents and accidents, to help the company optimize its insurance packages. Cubit Insurance turned to Euristiq for the IoT testing services for their telematics app.

IoT | AWS | Real-time asset tracking | Data collection & processing

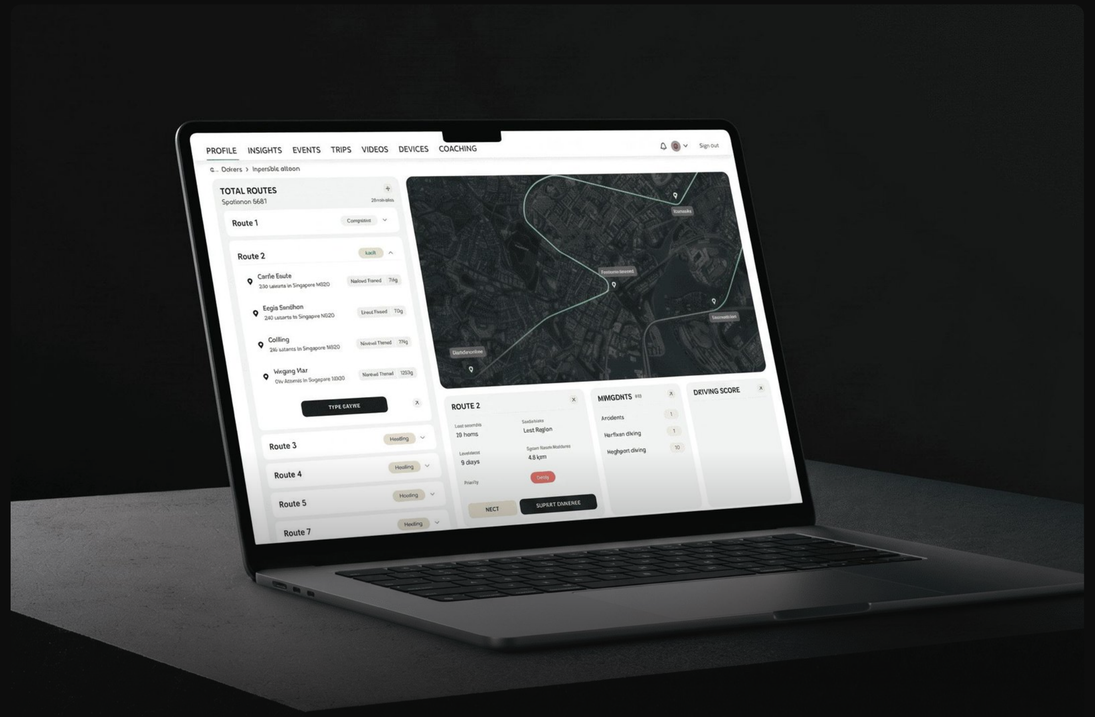

Outcomes

QA across hardware and software
Our QA team validated the telematics system's reliability under various conditions, including bumps and collisions, while identifying potential extra costs.

Faster, more efficient event categorization
Real-time messaging enables faster event categorization, reducing missed alerts and potential insurance losses.

Improved trip tracking
By maintaining dynamic location handling (start/end of the trip by checking vehicle speed and user behavior) the tracking experience was improved.
