Modernized Cannabis Extraction Software

Drizzle, the first manufacturer of fully automated home cannabis oil extraction and purification appliances, partnered with Euristiq to modernize and maintain its device software. The project focused on codebase refactoring and new frontend and backend features.

IoT | Legacy modernization | Data collection & processing

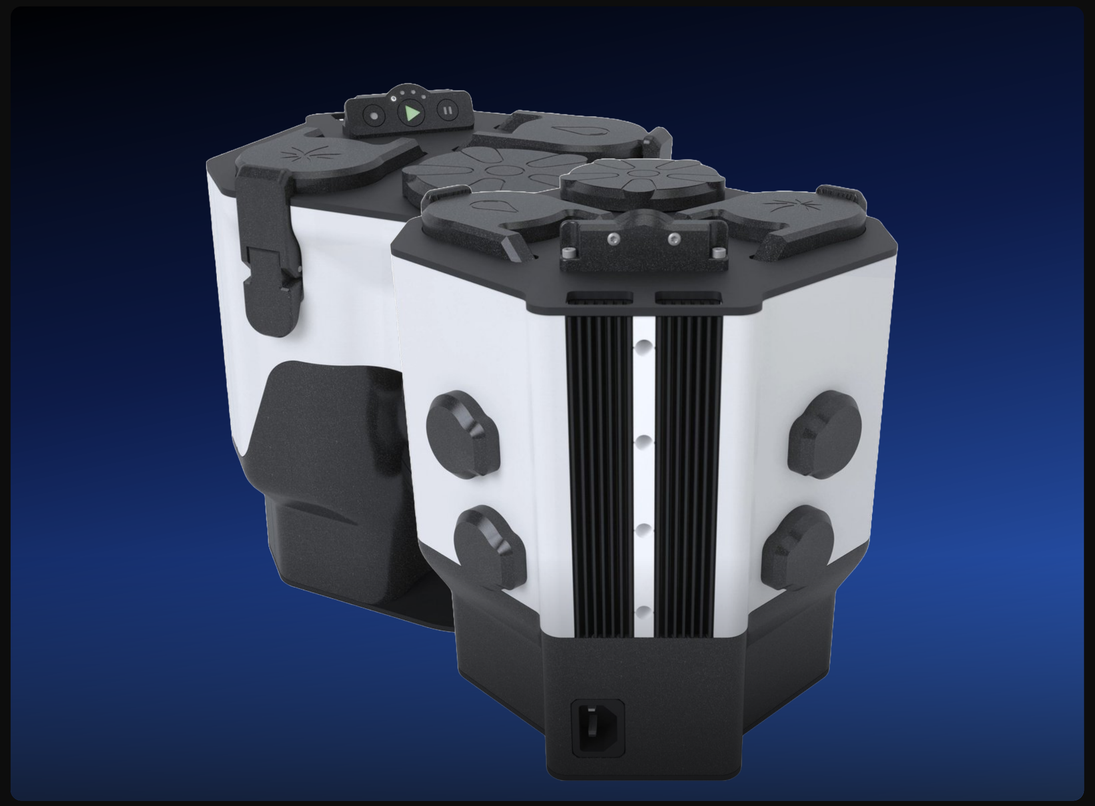

Outcomes

Solved technical debt and added maintainability to an IoT platform
Euristiq refactored the codebase and added new features on both frontend and backend, implementing processes such as testing and CI/CD that improved the development process.

Introduced automation to firmware updates
The new build is published through continuous integration, and new firmware is installed automatically in one package.

Improved code security and added new functionality to the device
The team implemented a secure way to update firmware over the air through built-in WiFi, and added new functionalities to the device — new actions that manage the device state.
