An IoT Device Management App

Novalume develops energy-efficient LED street lighting deployed at city scale. Its Lumintell platform already managed 2 million connected streetlights for city officials and lighting operators — but field crews installing and maintaining that hardware had no mobile way to work with it. Euristiq built the Android app development that closed that gap: an IoT mobile app development project purpose-built for on-site device management.

Mobile | UX/UI design | IoT | Azure | Legacy modernization | Digital twin | Real-time asset tracking | Data collection & processing

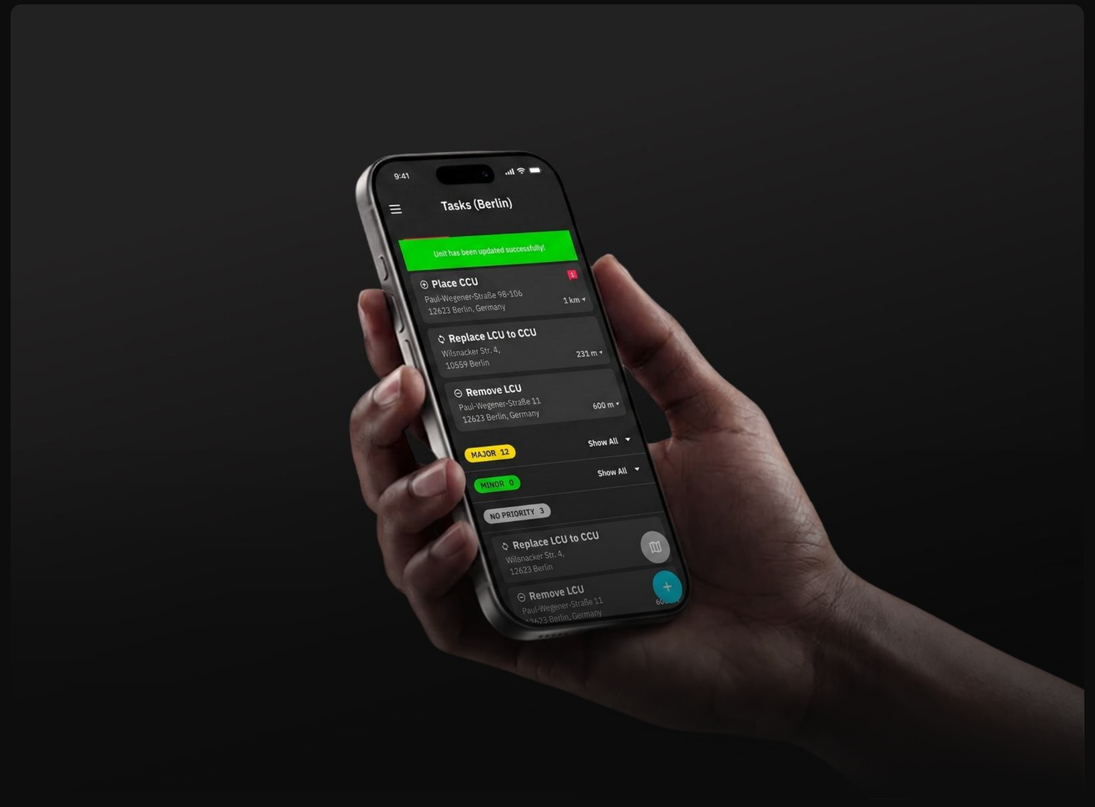

Outcomes

One-tap device onboarding
QR and NFC scanning replaced manual paperwork for every new streetlight install, syncing straight into the Lumintell platform.

2M connected devices, one app
Streetlights across multiple cities became visible and configurable from the field, not just from a back-office dashboard.

Multi-vendor plugin architecture
A plugin system lets the app support new device vendors without a full rebuild, protecting Novalume's hardware roadmap.
