Digital Identity Verification System

euristiq + Gen

Web development | DevOps | QA/QC testing | Architecture | Integration services | Cybersecurity & data protection

Client engaged Euristiq to build digital identity services suitable for governmental applications. During our collaboration we built a highly-secure blockchain-based identity platform.

This technology offers verifiable digital credentials, empowering end-users to manage their digital identities and provides interoperability between decentralized systems.

TECHNOLOGY STACK

GoLang | MongoDB | Postgres | MySQL | CouchDB | Vue.js | Node.js | WebAssembly | Blockchain technologies

AWS SERVICES

Document DB | Amazon RDS | CloudWatch | Elastic Kubernetes Service (EKS) | Key Management Service (KMS)

OUTCOMES

- Integration with government institutions, banks, and third-party databases for real-time verification
- Cloud-native AWS migration improving scalability and cost efficiency
- Microservices architecture enabling seamless updates and system modularity
- Compliant with W3C standards ensuring interoperability and future-proofing
- CI/CD pipeline with AWS DevOps for faster and more reliable releases
- End-to-end encryption and GDPR compliance for data privacy and security
