We replaced the manual, operator-dependent scheduling process with the AI-powered system. Using a human-in-the-loop approach, we left the function of oversight to operators, but reduced the time for creating schedules.

As a result, the client can produce significantly more schedules, serve more customers, and scale their product without increasing headcount.

AWS | AI | Conversational AI interface

OUTCOMES

- A working prototype was delivered in just 3 days
- A manual, time-consuming, limiting in scaling scheduling process is replaced by AI-powered system
- Scheduling is now done in minutes, not days and the client can serve more customers without increasing the staff
